Radioactive substances Cesium 137 in seawater data

This dataset represents the underlying seawater data on core indicator Radioactive substances: Cesium-137 in seawater. The core indicator evaluates the state of the environment using the concentration of the radioactive isotope cesium-137 (137Cs) in seawater. Quantitative thresholds are used to evaluate if core indicators status is Good, Not good or Not assessed. Good status is achieved when concentrations reach levels measured before the Chernobyl accident in 1986 when the biota of the Baltic Sea received the most significant contribution to their level of artificial radionuclides, predominantly in the form of 137Cs.

This dataset displays the result of the indicator in HELCOM Assessment Scale 2 (Division of the Baltic Sea into 17 sub-basins).

Attribute information:

"KEY" = MORS Database unique sample identifier

"COUNTRY" = Country of observation

"Year" = Year of observation

"STATION" = Name of station

"LATITUDE" = Latitude of station in WGS84 decimal degrees

"LONGITUDE" = Longitude of station in WGS84 decimal degrees

"TDEPTH" = Bottom depth at sampling site (m)

"SDEPTH" = Sampling depth (m)

"ASSESSMENT" = Name of scale 2 Helcom Assessment unit

"NUCLIDE" = Nuclide measured

"VALUE_Bq_m" = Value of measurement in Bq/m3

Statement	The pre-Chernobyl values used to derive the threshold value have been calculated based on data in the HELCOM MORS database. The data used for defining the threshold value for 137Cs concentrations in herring, flatfish (plaice and flounder) and surface waters were collected between 1984 and 1985. The mean pre-Chernobyl 137Cs concentrations have been used as threshold values. The evaluation of whether the threshold is achieved or not is carried out by calculating the mean value for all samples during the assessed year in each assessment unit and comparing this against the threshold values. Data covers most of the Baltic Sea. Data of each matrix (herring, plaice and flounder and sea water) have been averaged by sub-basin and by year. The data is collected by national authorities and reported annually to the HELCOM MORS Database. In addition to national quality assurance procedures, manual quality assurance is applied to the reported data and data entries are verified annually by the HELCOM MORS Expert Group.
